

RMS-1

Remote management software for LED displays

Barco's RMS-1 is user-friendly software for remote control, monitoring and diagnostics of the Barco NNI and DVI-based LED displays. It combines intelligent agent software with an intuitive, graphical interface for easy display control, making setup extremely easy.

The software is specifically designed for 24/7 hardware monitoring. Thanks to automatically generated email alerts, you always know the exact status of your LED display. Also, custom software can easily integrate the RMS-1 agent by using the standard web service interface.

A key feature of RMS-1 is its integrated intelligent brightness control. It automatically adjusts the billboard's brightness levels for optimal viewing experiences, in line with local legal limitations in any environment. The software can detect any kind of failure and has various built-in fail-safe mechanisms to automatically protect your content and hardware at all time.
