

# ULC-30A projector chiller

Single chiller for DP4K-L, XDL and LLS projector series

The ULC-30 A is an active cooling system designed for cooling the DMD's and lasers of our RGB laser projectors such as the DP4K and XDL series.

A closed cooling system keeps the lasers at a constant temperature, independently from ambient temperatures which enhances both lifetime and color stability.

Depending on the required light output, a single or dual configuration is used.
